Take home messages

This session is part of a broader course where you are given a hand-picked selection of topics. These vary quite a bit but there is common theme: Make sense of the mathematics we see (but don't quite grasp) in papers. This specific session is about vectors and stuff you can do with vectors.

- Know what vectors are and how to use them
- Know how to add and subtract and visualise vectors
- Know and use the dot or inner product
- Know and use the cross or outer product

Q

What is actually a vector and what a scalar?

A

A (Euclidian) vector describes a geometric entity that has both a *direction* and *magnitude*. In contrast, a scalar only represents a magnitude but *not* a direction. The components $(a_1, a_2, \ldots, a_n)$ of $\mathbf{a}$ are the lengths of the projection of $\mathbf{a}$ along the n coordinate axes.

Figure: $\mathbf{a} = \begin{pmatrix} 2 \\ 3 \end{pmatrix}$

Summary

Given two vectors

$$\mathbf{v} = \left(\begin{array}{c} a \\ b \end{array} \right)$$

and

$$\mathbf{w} = \left(\begin{array}{c} c \\ d \end{array} \right)$$

Vector addition is then simply

$$\mathbf{v} + \mathbf{w} = \left(\begin{array}{c} a + c \\ b + d \end{array} \right)$$

similarly:

$$\mathbf{v} - \mathbf{w} = \left(\begin{array}{c} a - c \\ b - d \end{array} \right)$$

## Vector addition

Question number 2 of the preparatory questions:

Let $P = (-2, -1)$, $Q = (-3, 3)$, and $R = (-1, -4)$ in the xy-plane.

- Draw these vectors: **v** joining P to Q; **w** joining Q to R, and **u** joining R to P
- What are the component vectors of **v**, **w** and **u**?
- What is **v** + **w** + **u**?

[ex 9. p. 13]

Vector inner and outer products
Summary

Scalar multiplication

if we have a vector

$$\mathbf{v} = \left(\begin{array}{c} a \\ b \end{array} \right)$$

then the scalar multiplication (with scalar s) equals:

$$s\mathbf{v} = \left(\begin{array}{c} sa \\ sb \end{array} \right)$$

Summary
Vectors: the inner product or dot product

The inner product has some nice features – it is often used to quantify the angle between two vectors. First let's define the inner product of **v** and **w**.

$$\mathbf{v} \cdot \mathbf{w} = v_1 w_1 + v_2 w_2 + v_3 w_3$$

The inner product of two vectors is thus a scalar quantity

Background
Vector addition and scalar multiplication
Vector inner and outer products
Summary

Important concepts in vector calculus are the length of a vector. From the Pythagorean theorem if easily follows that the length of vector

$$\mathbf{a} = \begin{pmatrix} a_1 \\ a_2 \\ a_3 \end{pmatrix}$$

is

$$||\mathbf{a}|| = \sqrt{a_1^2 + a_2^2 + a_3^2}$$

This quality is often called the norm of a. This can also be used to calculate the distance between the endpoints of e.g., a and b as $||\mathbf{a} - \mathbf{b}||$.

Background
Vector addition and scalar multiplication
Vector inner and outer products
Summary

So, the length –or norm– of a vector a is equal to

$$||\mathbf{a}|| = \sqrt{a_1^2 + a_2^2 + a_3^2}$$

Since $\mathbf{a} \cdot \mathbf{a} = a_1^2 + a_2^2 + a_3^2$, it follows that

$$||\mathbf{a}|| = \sqrt{\mathbf{a} \cdot \mathbf{a}} = (\mathbf{a} \cdot \mathbf{a})^{1/2}$$

Vectors with norm 1 are called unit vectors. It follows that for any (nonzero) vector, the unit vector can be obtained by dividing a by $||\mathbf{a}||$ and is also called a normalised a.

Background
Vector addition and scalar multiplication
Vector inner and outer products
Summary

One application of the inner product is that it can be used to determine the angle between two vector. How? Let's see. Remember the cosine rule?
$$c^2 = a^2 + b^2 - 2ab \cos C$$

Figure:

Background
Vector addition and scalar multiplication
Vector inner and outer products
Summary

So, by knowing the length of the three sides of a triangle we can obtain the angle between each pair of vectors; we know the length of the two vectors **a** and **b**. We also know the distance between them: $||\mathbf{b} - \mathbf{a}||$. Plugging these values into the cosine rule:

$$c^2 = a^2 + b^2 - 2ab\cos\theta$$

$$||\mathbf{b} - \mathbf{a}||^2 = ||\mathbf{a}||^2 + ||\mathbf{b}||^2 - 2||\mathbf{a}||||\mathbf{b}||\cos\theta$$

Since $||\mathbf{b} - \mathbf{a}||^2 = (\mathbf{b} - \mathbf{a}) \cdot (\mathbf{b} - \mathbf{a})$, $||\mathbf{a}||^2 = \mathbf{a} \cdot \mathbf{a}$ and $||\mathbf{b}||^2 = \mathbf{b} \cdot \mathbf{b}$, we can rewrite this as:

$$(\mathbf{b} - \mathbf{a}) \cdot (\mathbf{b} - \mathbf{a}) = \mathbf{a} \cdot \mathbf{a} + \mathbf{b} \cdot \mathbf{b} - 2||\mathbf{a}||||\mathbf{b}||\cos\theta$$

Background
Vector addition and scalar multiplication
Vector inner and outer products
Summary

Now

$$(\mathbf{b} - \mathbf{a}) \cdot (\mathbf{b} - \mathbf{a}) = \mathbf{b} \cdot (\mathbf{b} - \mathbf{a}) - \mathbf{a} \cdot (\mathbf{b} - \mathbf{a})$$

$$= \mathbf{b} \cdot \mathbf{b} - \mathbf{b} \cdot \mathbf{a} - \mathbf{a} \cdot \mathbf{b} + \mathbf{a} \cdot \mathbf{a}$$

$$= \mathbf{a} \cdot \mathbf{a} + \mathbf{b} \cdot \mathbf{b} - 2\mathbf{ab}$$

Thus

$$= \mathbf{a} \cdot \mathbf{a} + \mathbf{b} \cdot \mathbf{b} - 2\mathbf{ab} = \mathbf{a} \cdot \mathbf{a} + \mathbf{b} \cdot \mathbf{b} - 2||\mathbf{a}||||\mathbf{b}|| \cos \theta$$

That is,

$$= \mathbf{a} \cdot \mathbf{b} = ||\mathbf{a}||||\mathbf{b}|| \cos \theta$$

Practical application: physics

Q

A bird is flying in a straight line with velocity vector $10\,\mathbf{i} + 6\,\mathbf{j} + \mathbf{k}$ (in km/h). Suppose that (x, y) are its coordinates on the ground and z its height above the ground. [ex 11, p 35]

- If the bird is at $(1, 2, 3)$ at a certain moment, where is it 1h later?

- How many second does it take the bird to climb 10m?

Background
Vector addition and scalar multiplication
Vector inner and outer products
Summary

Orthogonal projection

The orthogonal projection **p** of **w** on **v** is the vector whose tip is obtained by dropping a perpendicular line to the line l (along v) from the top of **w**. We can obtain the projection as:

$$\mathbf{p} = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\|^2} \mathbf{v}$$

Figure:

Background
Vector addition and scalar multiplication
Vector inner and outer products
Summary

So, $\mathbf{v} = \begin{pmatrix} 1 \\ 3 \end{pmatrix}$

and $\mathbf{w} = \begin{pmatrix} 1 \\ 1 \end{pmatrix}$

$$\mathbf{v} \cdot \mathbf{w} = 1 * 1 + 3 * 1 = 4$$

$$\|\mathbf{v}\|^2 = 1^2 + 3^2 = 10$$

$$\mathbf{p} = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\|^2} \mathbf{v} = \frac{4}{10} \begin{pmatrix} 1 \\ 3 \end{pmatrix} = \begin{pmatrix} 0.4 \\ 1.2 \end{pmatrix}$$

Vectors: determinants and the cross-product

So far we've encountered

- vector addition
- scalar-product
- the inner-product closely related to the length of a vector and used to calculate the angle between vectors.

In what follows, we'll discuss another property of vector calculus: the outer product

Background
Vector addition and scalar multiplication
Vector inner and outer products
Summary

Background
Vector addition and scalar multiplication
Vector inner and outer products
Summary

Previously, we've encountered the inner product of two vectors that generated a scalar. In what follows we define a product of vectors that is a vector. Given two vectors **v** and **w**, we can obtain a third vector **v** × **w**, the cross-product of **v** and **w**. This vector will have the (pleasing) geometrical property that is it perpendicular to the plane spanned by **v** and **w**.

First, let's define a 2 x 2 matrix **M** as

$$\mathbf{M} = \left(\begin{array}{cc} a_{11} & a_{12} \\ a_{21} & a_{22} \end{array} \right)$$

the determinant is then defined as:

$$|\mathbf{M}| = \left| \begin{array}{cc} a_{11} & a_{12} \\ a_{21} & a_{22} \end{array} \right| = a_{11}a_{22} - a_{12}a_{21}$$

Background
Vector addition and scalar multiplication
Vector inner and outer products
Summary

or, with a 3 x 3 matrix:

$$\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = a_{11} \begin{vmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{vmatrix} - a_{12} \begin{vmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{vmatrix} + a_{13} \begin{vmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{vmatrix}$$

Background
Vector addition and scalar multiplication
Vector inner and outer products
Summary

or, with a 3 x 3 matrix:

$$
\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = a_{11} \begin{vmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{vmatrix} - a_{12} \begin{vmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{vmatrix} + a_{13} \begin{vmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{vmatrix}
$$

Background
Vector addition and scalar multiplication
Vector inner and outer products
Summary

the determinant is then defined as:

$$\begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix} = a_{11}a_{22} - a_{12}a_{21}$$

or, with a 3 x 3 matrix:

$$\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = a_{11}\begin{vmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{vmatrix} - a_{12}\begin{vmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{vmatrix} + a_{13}\begin{vmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{vmatrix}$$

Background

Summary

Cramer's law to linear equations (1750!)

Say we have a system of equations:

$$\begin{array}{rcl} 2x + y + z & = & 3 \\ x - y - z & = & 0 \\ x + 2y + z & = & 0 \end{array}$$

Or rewritten like $Ax = b$,

$$\begin{pmatrix} 2 & 1 & 1 \\ 1 & -1 & -1 \\ 1 & 2 & 1 \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} 3 \\ 0 \\ 0 \end{pmatrix}$$

This system can be solved (i.e., finding the values of x, y, z for which all three equations make sense) by using *determinants*.

Background
Vector addition and scalar multiplication
Vector inner and outer products
Summary

Cramer's law : step 1

First find the determinant of the equations:

$$\Delta = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = \begin{vmatrix} 2 & 1 & 1 \\ 1 & -1 & -1 \\ 1 & 2 & 1 \end{vmatrix} =$$

$$2 \begin{vmatrix} -1 & -1 \\ 2 & 1 \end{vmatrix} - 1 \begin{vmatrix} 1 & -1 \\ 1 & 1 \end{vmatrix} + 1 \begin{vmatrix} 1 & -1 \\ 1 & 2 \end{vmatrix} = ...$$

Background
Vector addition and scalar multiplication
Vector inner and outer products
Summary

Cramer's law : step 2

The next step is to plug the answer vector (the vector describing the results) into the three separate determinants – these are going to be used to determine the solution to the system of equations. So,

$$\Delta_x = \begin{vmatrix} 3 & 1 & 1 \\ 0 & -1 & -1 \\ 0 & 2 & 1 \end{vmatrix} = 3$$

$$\Delta_y = \begin{vmatrix} 2 & 3 & 1 \\ 1 & 0 & -1 \\ 1 & 0 & 1 \end{vmatrix} = -6$$

$$\Delta_z = \begin{vmatrix} 2 & 1 & 3 \\ 1 & -1 & 0 \\ 1 & 2 & 0 \end{vmatrix} = 9$$

Background
Vector addition and scalar multiplication
Vector inner and outer products
Summary

Cramer's law : step 3

The final step to the solution is Cramer's rule:

$$x = \frac{\Delta_x}{\Delta} = \frac{3}{3} = 1$$

$$y = \frac{\Delta_y}{\Delta} = \frac{-6}{3} = -2$$

$$z = \frac{\Delta_z}{\Delta} = \frac{9}{3} = 3$$

Exercise 1: check whether the above solution is a valid one.

Background
Vector addition and scalar multiplication
Vector inner and outer products
Summary

Exercise 2: check whether this method works for the following

$$
\begin{aligned}
2x + y + z &= 3 \\
x + y/2 + z/2 &= 3/2 \\
x + 2y + z &= 0
\end{aligned}
$$

Background
Vector addition and scalar multiplication
Vector inner and outer products
Summary

Geometry of 2x2 determinants

Let $\mathbf{a} = a_1\mathbf{i} + a_2\mathbf{j}$ and $\mathbf{b} = b_1\mathbf{i} + b_2\mathbf{j}$ be two vectors in the (i,j) plane. Then the cross-product can be described as a determinant:

$$\mathbf{a} \times \mathbf{b} = \left| \begin{array}{ccc} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ a_1 & a_2 & 0 \\ b_1 & b_2 & 0 \end{array} \right| = \left| \begin{array}{cc} a_1 & a_2 \\ b_1 & b_2 \end{array} \right| \mathbf{k}$$
This is a very interesting property: it indicates that the area $||\mathbf{a} \times \mathbf{b}||$ equals the absolute value of the determinant.

$$||\mathbf{a} \times \mathbf{b}|| = |a_1 b_2 - a_2 b_1|$$

Background
Vector addition and scalar multiplication
Vector inner and outer products
Summary

Geometry of 2x2 determinants

It can also be determined by determining

$$||\mathbf{a} \times \mathbf{b}|| = ||\mathbf{a}|| ||\mathbf{b}|| \sin\theta$$

Background
